# Errata

## On Coppock (2014), *Journal of Experimental Political Science* 1(2), and its 2016 corrigendum

This note lists one correction to "Information Spillovers: Another Look at Experimental Estimates of Legislator Responsiveness," published in *Journal of Experimental Political Science* 1(2):159–169, doi 10.1017/xps.2014.9. **It changes no estimate and no conclusion**: it is a count stated correctly once and misstated two sentences later.

Separately, the upper confidence bounds in the article and its appendix each sit one grid step too high, because the deposited code reports the first hypothesis outside each 95% region rather than the last one inside it; the maintained code corrects the rule, and no conclusion the article draws from those bounds changes.

The article's substantive correction is the 2016 corrigendum, *Journal of Experimental Political Science* 3(2):206–208, doi 10.1017/XPS.2016.8, which this note supplements and does not replace. The code supporting the maintained analysis, which reproduces both the article and the corrigendum, is at github.com/active-maintenance-aec/coppock_2014.

## The text

### 1. The number of possible random assignments is restated three orders of magnitude too large

Published, p. 162:

> would map each of the **30 trillion** random assignments onto just two potential outcomes

Corrected:

> would map each of the **34 billion** random assignments onto just two potential outcomes

Two sentences earlier, on p. 161, the article gives the same quantity as $2^{35} = 3.4 \times 10^{10}$, which the deposit confirms: 35 matched pairs, so 34,359,738,368 possible assignments. Thirty trillion is $3 \times 10^{13}$.
